Bold red = best, underlined = second best per column. Rank = mean over backbone columns of the per-column rank (ties averaged; NAVI over 14 rot/trans sub-columns). Params (M) = trainable parameters (probe + task head) for ViT-L backbones (D=1024, 24 layers). Mean of up to 3 seeds (8/42/123; a few cells have 1–2), best-epoch validation metric; frozen backbones; same training recipe for every row of a table. AMDF: depth-aware fusion, 16 expert queries, values projected to D/2, no bottleneck, no per-layer refinement.
